Notes on Data Sources and Methodology **of the Published Data**

This publication, presented in the form of statistical tables, **illustrates the development of selected household living-standard indicators** throughout the existence of the independent Czech Republic, i.e. **since 1993**.

All calculations are based on selected **data** obtained from the databases of the **Czech Statistical Office (CZSO)**, the **Czech National Bank (CNB)**, and the **Ministry of Labour and Social Affairs (MoLSA)**.

The development and structure of household income are documented primarily by data from the EU-SILC survey (European Union Statistics on Income and Living Conditions), whose national implementation under the title Living Conditions Survey has been conducted annually by the Czech Statistical Office since 2005 (with the income reference period referring to 2004). **The purpose of the survey is to obtain representative information on the income of different household types and related living-condition indicators**, including housing conditions, household equipment, economic situation and income distribution. Household income time series are recalculated from annual figures into monthly averages per household member. Income components in the survey are collected either as gross or net amounts; during processing, corresponding net or gross values are calculated in accordance with valid tax regulations. Individual and household net income components are subsequently aggregated into the principal national indicator of net monetary household income, presented in Table 1 and summarized in Table 2. Table 2 also provides a more detailed regional breakdown expressed in gross income categories, including employment income, self-employment income and social transfers. The regional classification by regions (NUTS 3) ends with the year 2023. Beginning in 2024, a new time series is introduced in Table 3 using cohesion regions (NUTS 2).

A basic overview of developments in **household-sector income, expenditure and savings at the macroeconomic level** is provided in Table 4. The source data are derived from the CZSO national accounts statistics.

The analysis of wage developments is based on CZSO statistics. Since January 2009, the publication of average wages has primarily focused on **full-time equivalent employees** (formerly on natural persons), thereby accounting for differences in working-time arrangements. In processing wage statistics, the CZSO applies non-

response estimation methods and estimates for the non-surveyed part of the population using administrative data sources (i.e. the average gross monthly wage for the whole national economy includes data for all employees). Another important methodological change was the transition to publishing wage data according to the CZ-NACE Classification of Economic Activities (the national version of NACE Rev. 2), replacing the previously used OKEČ classification (the national version of NACE Rev. 1.1). Wage data adjusted for these methodological changes are available from the year 2000 onwards only. Regional wage statistics until 2010 were compiled according to the enterprise method (based on the registered office of the reporting entity) and therefore may not fully reflect the actual situation within a given territory. Since 2011, regional data have been compiled according to the workplace method, based on employees' actual workplace locations. Separate monitoring of average wages in the business and non-business sectors was last published for 2016 and has not been available since the 2017 reference year. Certain differences between figures reported in this publication and official CZSO outputs result from differences in methodologies used for constructing time series and reporting current-period data.

Nominal developments in old-age pensions are based on MoLSA data, while calculations of their real value use official cost-of-living indices published by the CZSO.

The Household Budget Survey (HBS) constitutes a comprehensive source of information on household economic behaviour, **providing data on expenditure levels and consumption structure**. Information on differences in consumption between households classified according to various criteria, or on the effects of different factors on expenditure structures and consumption habits, cannot be obtained from other statistical sources.

For the period 1993-2000, nominal net monetary expenditures are presented by the status of the household head (Table 12). Consumer expenditure data for individual household types have been monitored since 2000 and form two separate time series (Tables 13-16). Until 2016, pensioner households were defined as households headed by a pensioner with no economically active members. Between 2017 and 2022 they were defined as households without working members. Since 2023, pensioner households are classified solely according to the status of the household head, irrespective of the economic activity of other members. Unless otherwise stated, **all data derived from the HBS are presented on a per-capita basis. Where average values per household are required, the table presenting the average number of household members may be used** (see the table at the end of this text).

Until 2015, the HBS sample was selected through quota sampling and comprised approximately 3,000 households reflecting the structure of Czech households according to the status of the household head, number of children (or other household members), and net income per capita. Various statistical surveys (especially Microcensus) were formerly used to determine the quotas, since 2006 it has been mostly the Living Conditions survey (implemented as a national EU-SILC survey module). Until 2010, an additional subsample of approximately 400 families with children and incomes slightly above the subsistence minimum provided representative data for low-income families with children. The composition of the sample was continuously adjusted over time to reflect shifts in key household characteristics such as composition, economic activity and income levels. These adjustments may have influenced certain relative indicators but did not significantly affect long-term trends.

Following the implementation of the Integrated European Social Statistics (IESS) framework, which requires the integration of household social surveys and the use of random sample surveys, the CZSO reformed the HBS. **In 2016, quota sampling was used for the final time on a reduced sample, enabling representative outputs only in a limited range and level of detail.** The sample of approximately 1,600 households was designed to correspond to the structure of Czech households according to selected characteristics. The results of the Living Conditions survey served as a support for setting the quotas.

Following the reform, the HBS became more integrated into the Living Conditions Survey (EU-SILC), and the current HBS sample is derived from the EU-SILC random sample. Consequently, the time series presented in Tables 13 and 14 end in 2016. **Published HBS data for 2016 were modified to reflect the limitations of the reduced sample, and the level of detail was substantially reduced.** Only information on total net money expenditure was retained. Balance sheet items, detailed data on non-consumption expenditure and total consumption, ceased to be published. Expenditure categories include only consumer expenditures. Therefore, expenditure detail was limited to aggregated data covering the twelve main COICOP divisions.

Because of these substantial methodological changes, time-series tables on net money expenditures and direct financial savings of selected household types are not included in the yearbook. Tables containing total monetary expenditures and the structure of consumer expenditures have been retained.

Since 1999, consumer expenditure has been classified according to CZ-COICOP, the Czech version of the international Classification of Individual Consumption by Purpose (COICOP). Household consumer expenditures are organized into twelve divisions. The broad category “Miscellaneous goods and services” includes personal care products and services, personal accessories, all types of insurance, and administrative and other fees. Expenditures not covered by CZ-COICOP, such as investment expenditure on housing construction or renovation and expenditure related to household gardening or livestock keeping, were included until 2015 in a separate category entitled “Non-Consumption Expenditure”. This category has not been published since 2016.

HBS expenditures are classified according to the revised COICOP classification since the year 2023. Due to the adjustment of the classification, the published results are comparable with previous years only to a limited extent. Less significant changes in the classification of expenditure items occurred in Divisions 1 to 7, 10 and 11, for which an indicative comparison with previous years is possible. Divisions 8, 9 and 12, as well as the new Division 13, cannot be compared with previous years due to their different content. Therefore, data from 2023 onwards are presented separately in Table 16.

Consumer price indices (cost-of-living indices) are harmonized with the price statistics framework used in the European Union. Aggregate consumer price indices reported by the CZSO remain fully valid. Time series describing price developments within the basic consumption basket groups remain comparable over time. **Since 2009, the aggregate cost of the living index has been reported only for households in total, households of pensioners and households in the capital of Prague.** Table 20 presents average prices of selected goods and services. In the time series there are continuous changes of used representatives.

The overview of inflation developments is supplemented by the Harmonised Index of Consumer Prices (HICP). Comparisons with European Union Member States are based on a consumption basket specifically adjusted for this purpose; therefore, Czech HICP figures differ from other inflation indicators presented in the publication. Certain differences exist between the basket structure of the Czech national CPI and the HICP. **The HICP includes expenditure by foreign visitors in the Czech Republic but excludes imputed rent, whereas the national CPI excludes expenditure by foreign visitors and includes imputed rent.**

Data on the total volume of household deposits and loans originate from the banking statistics of the Czech National Bank and are published in the ARAD time-series database. Household deposits are further distinguished between overnight and term deposits. The time series of household bank loans focuses more closely on the development of total housing loans.

Internationally comparable data on the share of the population living below the at-risk-of-poverty threshold between 2005 and 2025 are provided in Table 27. The at-risk-of-poverty rate is the share of people with an equivalised disposable income (after social transfers) below the at-risk-of-poverty threshold, which is set at 60 % of the national median equivalised disposable income after social transfers. Source data are based on EU-SILC surveys for the years 2005-2025 and are published by Eurostat.

The primary objective of the publication is mostly to illustrate long-term trends. In certain areas, such as the HBS and selected wage indicators, complete methodological and conceptual comparability over time could not be achieved. Wherever methodological or content-related changes were substantial, shorter time series or separate methodologically comparable sections are presented.

All data for 2025 should be regarded as preliminary. National accounts data are preliminary for all reported years.

Note: Data marked with an asterisk (*) indicate that the information was either not statistically surveyed in the respective year or was unavailable at the time of publication.

The publication contains data valid as of August 31, 2026.

2014	25 884	102.5	100.4	102.1
2015	26 831	103.7	100.3	103.4
2016	28 075	104.6	100.7	103.9

Note: The spheres are delimited using the ESA 1995 methodology for the national accounts compilation. Starting in 2012 reporting units were moved in an administrative manner in between the business sphere and the non-business one. More accurate classification was performed on the basis of the so-called 50% criterion (originating from the share of financial resources intended for the cover of operational costs). The time series of average wages is methodologically comparable since 2010, because the data for 2010 and 2011 were recalculated according to the same methodology. This classification was published for the last time for 2016 and it is not available since 2017.

Average Gross Monthly Nominal Wage
(Per Natural Persons)
in the Years 2000 - 2025

a) National Economy (in total)

Processed from the data of CZSO	Monthly nominal wage in CZK	Indicies in %
